

Frequently Asked Questions

How do I remove a fan wheel from the motor's shaft?

1. Loosen set screw #1 (see below) until it is sticking out of the bushing approximately 1/8".

2. Completely remove set screw #2 from its initial location and place it into the other open hole (see below).

3. Tighten set screw #2 (see below) until the wheel disengages from the bushing. The disengagement occurs when the wheel separates from the bushing approximately 1/8".

4. Slide the bushing/wheel assembly off the motor shaft.
